

LAPORAN TUGAS 13
Pemrograman Web Berbasis Framework

PERTEMUAN 13

Oleh:

Bagus Satria putra

1841720146 TI-3F

PROGRAM STUDI D-IV TEKNIK
INFORMATIKA JURUSAN TEKNOLOGI
INFORMASI POLITEKNIK NEGERI MALANG
27 MEI 2021

Membuat Project Laravel

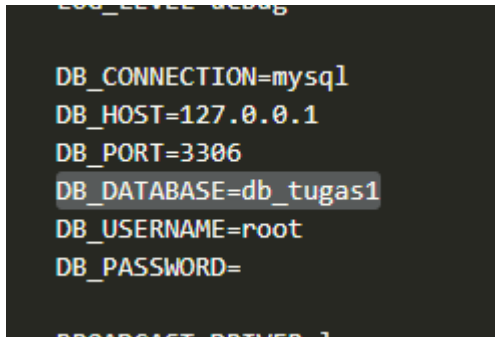

Link Github :

<https://github.com/BagusSatria123/PemrogramanFrameworkReact/tree/master/Pertemuan13>

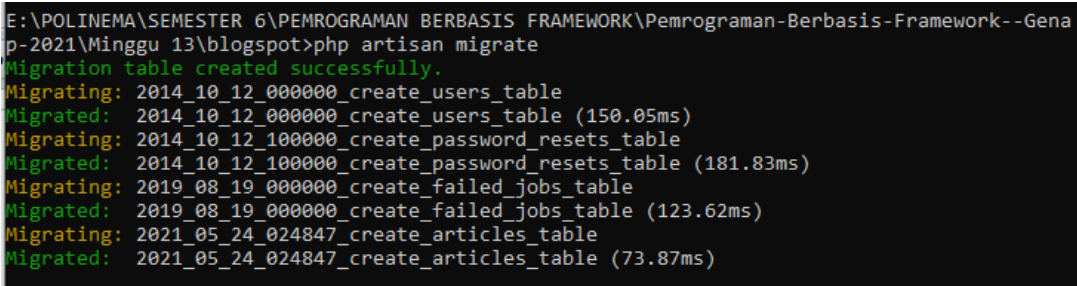

Link Youtube : <https://youtu.be/MInayHJq2Xw>

Nomor	Keterangan
1	Hal pertama yang harus dilakukan dalam praktikum ini adalah masuk ke direktori untuk yang akan digunakan sebagai tempat projectnya
2	Setelah memastikan di direktori mana akan ditempatkan laravel, maka akan lanjut dengan membuat project laravel dengan perintah seperti dibawah ini
	<pre>laravel new blogspot</pre> 

Create Database dan Migration Table

Nomor	Keterangan
1	<p>buka file .env yang ada di direktori blogspot/.env</p> <pre>DB_CONNECTION=mysql DB_HOST=127.0.0.1 DB_PORT=3306 DB_DATABASE=db_blogspot_react DB_USERNAME=root DB_PASSWORD=</pre> 
2	<p>ketik command berikut untuk membuat Model Article dan Migration-nya</p>

	<pre>php artisan make:model Article --migration</pre> <div> <pre>E:\POLINEMA\SEMESTER 6\PEMROGRAMAN BERBASIS FRAMEWORK\Pemrograman-Berbasis-Framework--Gena p-2021\Minggu 13\blogspot>php artisan make:model Article --migration Model created successfully. Created Migration: 2021_05_24_024847_create_articles_table</pre> </div>
3	<p>Sekarang buka file Article.php yang ada di dalam direktori app/Article.php dan modifikasi</p> <pre><?php namespace App; use Illuminate\Database\Eloquent\Model; class Article extends Model { protected \$table = "articles"; protected \$fillable = ['judul', 'genre', 'tahun', 'score', 'deskripsi']; }</pre>
4	<p>Kemudian, buka file *****create_articles_table.php yang tersimpan di direktori database/migrations dan modifikasi seperti kode di bawah ini</p> <pre><?php use Illuminate\Database\Migrations\Migration; use Illuminate\Database\Schema\Blueprint; use Illuminate\Support\Facades\Schema; class CreateArticlesTable extends Migration { public function up() { Schema::create('articles', function (Blueprint \$table) { \$table->bigIncrements('id'); \$table->string('judul'); \$table->string('genre'); \$table->string('tahun'); \$table->string('score'); \$table->string('deskripsi'); \$table->timestamps(); }); } }</pre>

	<pre> public function down() { Schema::dropIfExists('articles'); } </pre>
5	<p>Kemudian jalankan command berikut ini agar table yang kita buat migrate ke database</p> <pre>php artisan migrate</pre> 
Setting Route Web dan Api	
Nomor	Keterangan
1	<p>Buka file routes/web.php dan silahkan modifikasi</p> <pre> <?php use Illuminate\Support\Facades\Route; Route::view('/articles', 'app'); Route::view('/article/edit/{id}', 'app'); Route::view('/article/{id}', 'app'); Route::view('/', 'app'); Route::view('/{path}', 'app'); </pre>
2	<p>Kemudian buka file routes/api.php dan modifikasi</p> <pre> <?php use Illuminate\Support\Facades\Route; Route::get('/articles', 'App\Http\Controllers\ArticleController@index'); Route::post('/article/store', 'App\Http\Controllers\ArticleController@store'); Route::get('/article/edit/{id}', 'App\Http\Controllers\ArticleController@getArticle'); Route::get('/article/{id}', 'App\Http\Controllers\ArticleController@getArticle'); </pre>

	<pre>Route::put('/article/{id}', 'App\Http\Controllers\ArticleController@update'); Route::delete('/article/delete/{id}', 'App\Http\Controllers\ArticleController@delete');</pre>
Buat Controller Article	
Nomor	Keterangan
1	<p>Ketik command di bawah ini untuk membuat controller baru bernama ArticleController</p> <pre>php artisan make:controller ArticleController</pre> <pre>E:\POLINEMA\SEMESTER 6\PEMROGRAMAN BERBASIS FRAMEWORK\Pemrograman-Berbasis-Framework--Gena p-2021\Minggu 13\blogspot>php artisan make:controller ArticleController Controller created successfully.</pre>
2	<p>Sekarang buka file ArticleController.php yang terdapat di app/Http/Controllers. Kemudian ketik kode berikut ini</p> <pre><?php namespace App\Http\Controllers; use Illuminate\Http\Request; class ArticleController extends Controller { public function index() { \$articles = \App\Article::all(); return \$articles->toJson(); } public function store(Request \$request) { \$validatedData = \$request->validate(['judul' => 'required', 'genre' => 'required', 'tahun' => 'required', 'score' => 'required', 'deskripsi' => 'required',]); \$project = \App\Article::create(['judul' => \$validatedData['judul'],</pre>

```

        'genre' => $validatedData['genre'],
        'tahun' => $validatedData['tahun'],
        'score' => $validatedData['score'],
        'deskripsi' => $validatedData['deskripsi'],
    ]);

    $msg = [
        'success' => true,
        'message' => 'Article created successfully!'
    ];

    return response()->json($msg);
}

public function getArticle($id) // for edit and show
{
    $article = \App\Article::find($id);

    return $article->toJson();
}

public function update(Request $request, $id)
{
    $validatedData = $request->validate([
        'judul' => 'required',
        'genre' => 'required',
        'tahun' => 'required',
        'score' => 'required',
        'deskripsi' => 'required',
    ]);

    $article = \App\Article::find($id);
    $article->judul = $validatedData['judul'];
    $article->genre = $validatedData['genre'];
    $article->tahun = $validatedData['tahun'];
    $article->score = $validatedData['score'];
    $article->deskripsi = $validatedData['deskripsi'];

    $article->save();

    $msg = [
        'success' => true,
        'message' => 'Article updated successfully'
    ];

```

```

        return response()->json($msg);
    }

    public function delete($id)
    {
        $article = \App\Article::find($id);
        if(!empty($article)){
            $article->delete();
            $msg = [
                'success' => true,
                'message' => 'Article deleted successfully!'
            ];
            return response()->json($msg);
        } else {
            $msg = [
                'success' => false,
                'message' => 'Article deleted failed!'
            ];
            return response()->json($msg);
        }
    }
}

```

Install Package UI React, React Router Dom dan Sweat Alert

Nomor	Keterangan
1	Jika Anda ingin menginstall package React Js, React Router Dom dan Sweat Alert, silahkan dimulai dari install package laravel ui dan laravel ui react berikut ini
	composer require laravel/ui

	<pre> E:\POLINEMA\SEMESTER 6\PEMROGRAMAN BERBASIS FRAMEWORK\Pemrograman-Berbasis-Framework--Gena p-2021\Minggu 13\blogspot>composer require laravel/ui Using version ^3.2 for laravel/ui ./composer.json has been updated Running composer update laravel/ui Loading composer repositories with package information Updating dependencies Lock file operations: 1 install, 0 updates, 0 removals - Locking laravel/ui (v3.2.1) Writing lock file Installing dependencies from lock file (including require-dev) Package operations: 1 install, 0 updates, 0 removals - Downloading laravel/ui (v3.2.1) - Installing laravel/ui (v3.2.1): Extracting archive Generating optimized autoload files > Illuminate\Foundation\ComposerScripts::postAutoloadDump > @php artisan package:discover --ansi Discovered Package: facade/ignition Discovered Package: fideloper/proxy Discovered Package: fruitcake/laravel-cors Discovered Package: laravel/sail Discovered Package: laravel/tinker Discovered Package: laravel/ui Discovered Package: nesbot/carbon Discovered Package: nunomaduro/collision Package manifest generated successfully. 74 packages you are using are looking for funding. Use the `composer fund` command to find out more! </pre>
2	<p>Kemudian install react js</p> <pre>php artisan ui react</pre> <pre> E:\POLINEMA\SEMESTER 6\PEMROGRAMAN BERBASIS FRAMEWORK\Pemrograman-Berbasis-Framework--Gena p-2021\Minggu 13\blogspot>php artisan ui react React scaffolding installed successfully. Please run "npm install && npm run dev" to compile your fresh scaffolding. </pre>
3	<p>Lalu install NodeJsnya</p> <pre>npm install</pre> <pre>npm run dev</pre>

	<pre> E:\POLINEMA\SEMESTER 6\PEMROGRAMAN BERBASIS FRAMEWORK\Pemrograman-Berbasis-Framework--Genap-2021\Minggu 13\blogspot>npm install npm WARN optional SKIPPING OPTIONAL DEPENDENCY: fsevents@2.3.2 (node_modules\chokidar\node_modules\fsevents): npm WARN notsup SKIPPING OPTIONAL DEPENDENCY: Unsupported platform for fsevents@2.3.2: wanted {"os":"darwin","arch":"any"} (current: {"os":"win32","arch":"x64"}) npm WARN optional SKIPPING OPTIONAL DEPENDENCY: fsevents@1.2.13 (node_modules\fsevents): npm WARN notsup SKIPPING OPTIONAL DEPENDENCY: Unsupported platform for fsevents@1.2.13: wanted {"os":"darwin","arch":"any"} (current: {"os":"win32","arch":"x64"}) audited 1195 packages in 62.602s 97 packages are looking for funding run `npm fund` for details found 34 moderate severity vulnerabilities run `npm audit fix` to fix them, or `npm audit` for details </pre>

Manejement CRUD React Js di Laravel 7

Nomor	Keterangan
1	<p>Buat file baru bernama App.js dan simpan di direktori resources/js/components. Ketik kode berikut ini</p> <pre>import React, { Component } from 'react' import ReactDOM from 'react-dom' import { BrowserRouter, Route, Switch } from 'react-router-dom' import Header from './Header' import ArticleIndex from './ArticleIndex' import ArticleCreate from './ArticleCreate' import ArticleShow from './ArticleShow' import ArticleEdit from './ArticleEdit' class App extends Component { render () { return (<BrowserRouter> <div> <Header /> <Switch> <Route exact path='/' component={ArticleIndex} /> <Route exact path='/create' component={ArticleCrea te} /> <Route path='/article/edit/:id' component={Article Edit} /> <Route path='/article/:id' component={ArticleShow} /> </Switch></pre>

	<pre> </div> </BrowserRouter>) } } </pre> <p>ReactDOM.render(<App />, document.getElementById('app'))</p>
2	<p>Buat lagi file baru bernama Header.js dan simpan di direktori resources/js/components.</p> <pre> import React from 'react' import { Link } from 'react-router-dom' const Header = () => (<nav className='navbar navbar-dark bg-dark'> <div className='container'> <Link className='navbar-brand' to='/'>tugas laravel</Link> </div> </nav>) export default Header </pre>
3	<p>Buat lagi file baru bernama ArticleIndex.js dan simpan di direktori resources/js/components.</p> <pre> import axios from 'axios' import React, { Component } from 'react' import { Link } from 'react-router-dom' import SweetAlert from 'react-bootstrap-sweetalert'; class ArticleIndex extends Component { constructor () { super() this.state = { articles: [], msg: null, type: null, flash: false, alert: null, } } hideAlert() { this.setState({ alert: null }); } </pre>

```

    }

    componentDidMount () {
      axios.get('/api/articles').then(response => {
        this.setState({
          articles: response.data
        })
      })
    }

    confirmDelete(id){
      const getAlert = () => (
        <SweetAlert
          warning
          showCancelButton
          confirmBtnText="Hapus Deh"
          cancelButtonText="Nggak Jadi"
          confirmBtnBsStyle="default"
          cancelButtonBsStyle="danger"
          title="Tunggu ..."
          onConfirm={() => this.deleteItem(id)}
          onCancel={() => this.hideAlert()}
          focusCancelButton
        >
        Kalau udah dihapus, nggak bakal balik lagi.
      </SweetAlert>
    );
    this.setState({
      alert: getAlert()
    });
  }

  deleteItem(id) {
    axios.delete(`/api/article/delete/${id}`).then(response => {
      var msg = response.data.success;
      if(msg == true){
        this.hideAlert();
        this.goToHome();
      }
    })
  }

  goToHome(){
    const getAlert = () => (

```

```

        </div>
      </div>
    </div>
  </div>
</div>
)
}
}

```

```
export default ArticleIndex
```

4 Buat lagi file baru bernama **ArticleCreate.js** dan simpan di direktori **resources/js/components**. Ketik kode berikut ini:

```

import axios from 'axios'
import React, { Component } from 'react'
import { Link } from 'react-router-dom'
import SweetAlert from 'react-bootstrap-sweetalert';

class ArticleCreate extends Component {

  constructor(props) {
    super(props)
    this.state = {
      judul: '',
      genre: '',
      tahun: '',
      score: '',
      deskripsi: '',
      alert: null,
      errors: []
    }
    this.handleChange = this.handleChange.bind(this)
    this.createNewArticle = this.createNewArticle.bind(
      this)
    this.hasErrorFor = this.hasErrorFor.bind(this)
    this.renderErrorFor = this.renderErrorFor.bind(this)
  }

  handleFieldChange (event) {
    this.setState({
      [event.target.name]: event.target.value
    })
  }

  goToHome(){

```

```

const getAlert = () => (
  <SweetAlert
    success
    title="Success!"
    onConfirm={() => this.onSuccess() }
    onCancel={this.hideAlert()}
    timeout={2000}
    confirmBtnText="Oke Siap"
  >
    Created article successfully
  </SweetAlert>
);
this.setState({
  alert: getAlert()
});
}

onSuccess() {
  this.props.history.push('/');
}

hideAlert() {
  this.setState({
    alert: null
  });
}

handleCreateNewArticle (event) {
  event.preventDefault()
  const article = {
    judul: this.state.judul,
    genre: this.state.genre,
    tahun: this.state.tahun,
    score: this.state.score,
    deskripsi: this.state.deskripsi
  }
  axios.post('/api/article/store', article).then(response => {
    var msg = response.data.success;
    if(msg == true){
      return this.goToHome();
    }
  })
}

hasErrorFor (field) {

```

```

    return !!this.state.errors[field]
  }

  renderErrorFor (field) {
    if (this.hasErrorFor(field)) {
      return (
        <span className='invalid-feedback'>
          <strong>{this.state.errors[field][0]}</strong>
        </span>
      )
    }
  }

  render () {
    return (
      <div className='container py-4'>
        <div className='row justify-content-center'>
          <div className='col-md-6'>
            <div className='card'>
              <div className='card-
header'>Create new project</div>
              <div className='card-body'>
                <form onSubmit={this.handleClickCreateNewArticle}>
                  <div className='form-group'>
                    <label htmlFor='judul'>judul</label>
                    <input
                      id='judul'
                      type='text'

Buat Halaman View

Nomor	Keterangan
1	<p>Buat file baru bernama app.blade.php dan simpan di direktori resource/views. Sekarang ketik kode berikut</p> <pre> <!DOCTYPE html> <html lang="{{ app()->getLocale() }}"> <head> <meta charset="utf-8"> <meta http-equiv="X-UA-Compatible" content="IE=edge"> <meta name="viewport" content="width=device-width, initial- scale=1"> <!-- CSRF Token --> <meta name="csrf-token" content="{{ csrf_token() }}"> <title>React Laravel</title> <!-- Styles --> <link href="{{ asset('css/app.css') }}" rel="stylesheet"> </head> <body> <div id="app"></div> <script src="{{ asset('js/app.js') }}"></script> </body> </html> </pre>

Edit app.js

Nomor	Keterangan
1	Silahkan buka file resources/js/app.js kemudian cari kode berikut

	<pre>require('./components/Example');</pre>
	Ubah menjadi kode berikut
	<pre>require('./components/App');</pre>
Testing CRUD Laravel 7 dan React Js	
Nomor	Keterangan
1	<p>Ketik command berikut untuk menginstall perubahan yang terjadi</p> <pre>npm run dev</pre> 
2	<p>Kemudian ketik command berikut</p> <pre>php artisan serve</pre> 
3	<p>URL Halaman Index</p> <pre>localhost:8000</pre>
